

## **Mission #9 Assignment**

IS 413 – Hilton

With March Madness upon us, we want to create a website that lists out information about all the colleges in NCAA Basketball. The attached file contains a JSON file that has information for the basketball teams:

<https://byu.box.com/s/2wqd1pl166n4i39whcu8vircol19eozx>

Download the JSON file and paste it into your “src” folder.

Using your setup in Visual Studio Code, build a website in React that has at least three different functions/components in addition to the App function:

#1: A heading section at the top introducing the user to what the site is.

#2: A team “card” that contains the following information about each school:

- School Name
- Mascot Name
- Location (City, State)

#3: A list of team cards that shows all the teams on the list.

Incorporate the components into your website to display a list of all the college basketball teams. You will need to figure out how to make the connection to the JSON file to pull the data rather than building the JSON in a const in the code itself like we did in the videos. (#notcoveredinthevideos)

**Submit a link to the GitHub repository containing your project via Learning Suite.**
